Conclusion

Internet of Things (IoT)

- Exponential growth during last decades,
- over 50 billions connected devices expected soon,

and yet…

- detection/synchronization metadata can represent more than 50% of the consumed resources.

Spatial Technologies

- Require stability and certainty
  and…

- Cyclic-Code Shift Keying (CCSK) is used by *Quasi-Zenith Satellite System*

(Japanese satellite navigation enhancement system)

- Non-Binary Error Correcting Codes are used in BeiDou

(Chinese satellite navigation system)

Detection
The harder part

Principle :
<u>Compare</u> a detection score against a threshold [5].

Score ϖ cumulative sum of the maxima of the N last correlation with the CCSK sequence $\mathbf{P}_0$, thus representing the *likelyhood* of the last frame-long buffer to be a frame.

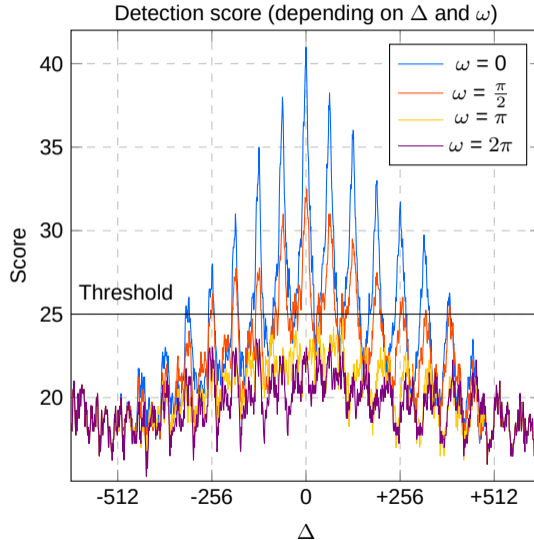

Time granularity p_Δ: score values calculated every q chips.

Using FFT/IFFT

Legacy method, inherited from the literature[2].

Pros:

- flexibility,
- independent processing along $//_\Delta$ and $//_\omega$,
- FFTs are already optimized,
- FIFO memory can be shared or distributed.

Cons:

- batch processing,
- not well suited for dataflow tasks,
- consumption.

Conclusion
Bibliography

Recently introduced method [3].

Pros:

- independent processing along $//_\omega$,
- quite lighter, complexity speaking (for equivalent p_Δ, p_ω),
- dataflow by design.

Cons:

- requires p_Δ set at q,
- memory sharing is harder.

Using Time Sliding Windows

Correlation Methods

Algorithmic Complexities comparison

when $p_\Delta = q$ (which also results in better reliability), TS has a clear advantage.

a QCSP
Communication
System

C. MONIÈRE et al.

Detector

Software Implementation

Benchmarked on a Linux server, equipped with an Intel Xeon-6148 Gold
dual socket, 20 cores/socket, 256 GB of RAM, clocked to 3.5 GHz in average.

FFT Method

- FFT implemented thanks to FFTW[6]

FFTW

- Implemented monothreaded and multithreaded along $//_\Delta$ using OpenMP

Time Sliding Method

- Written from scratch in C++11
- Implemented to make use of GCC vectorization feature (SIMD, loop unrolling, …)

Detector

Results

Slowest ⇒ FFT with $p_\Delta = 16$ and $p_\omega = 8$

Fastest ⇒ FFT MT with $p_\Delta = 8$ and $p_\omega = 4$
    → but the lowest detection performances

— However —

Time Sliding ($p_\omega = 4$) achieve better
throughput than FFT MT ($p_\Delta = 16$, $p_\omega = 8$),
for comparable detection performances and
$16\times$ less CPU power

Detector

Hardware Implementation

Results given by the Xilinx HLS tool (after place and route stage) for a Kintex 7 clocked at 100MHz

- FFT data are synthetic, extrapolated from one optimized core which processes 16-bits fixed-point data

- Time Sliding data correspond to a full system processing floating-point data

Both written in C/C++ for HLS, optimized for throughput at all costs (to explore the limits)

Detector

Results

Fastest ⇒ Time Sliding with the highest detection performances ($p_\omega = 4$)

Time sliding with $p_\omega = 8$ cannot be implemented (neither FFT because of DSP, lowering their number would affect throughput …)

Suited for Wireless Sensor Networks

Efficient
Implementations of
a QCSP
Communication
System

C. MONIÈRE et al.

The QCSP transmitter is low-cost and low-complexity.

An implementation of the receiver have achieved throughput allowing real-time frame detection, for an acceptable complexity for a high end base station

The new time sliding method is undoubtedly the best for dataflow processing

Suited for Wireless Sensor Networks

But still work to do

Efficient
Implementations of
a QCSP
Communication
System

C. MONIÈRE et al.

A fixed-point model of the receiver has been defined and is at last stage of implementation on FPGA

A way to process small batch of data using the time sliding method has been imagined, and may reduce memory usage

The remains of the communication system must be optimized

Multi-user scenarios are currently explored

Last achievement

Frame not detected
Frame decoded
≃ 500 m

- ▶ GPS location of a moving device sent using QCSP modulation

- ▶ Software detector running on the roof of a building

- ▶ Achieved a range of 500 m with low-quality antennas

- ▶ For a consumption lower than 1 μJ per information bit

Thank you for your attention, have you any question ?
